WARNING

This equipment must be used by qualified personnel. Be sure that all installation, operation, maintenance and repair procedures are performed only by qualified individuals. Read and understand this manual before operating this equipment. Failure to follow the instructions in this manual could cause serious personal injury, loss of life, or damage to this equipment. Read and understand the following explanations of the warning symbols. Lincoln Electric is not responsible for damages caused by improper installation, improper care or abnormal operation.

	WARNING: This symbol indicates that instructions must be followed to avoid serious personal injury, loss of life, or damage to this equipment. Protect yourself and others from possible serious injury or death.
	READ AND UNDERSTAND INSTRUCTIONS: Read and understand this manual before operating this equipment. Arc welding can be hazardous. Failure to follow the instructions in this manual could cause serious personal injury, loss of life, or damage to this equipment.
	ELECTRIC SHOCK CAN KILL: Welding equipment generates high voltages. Do not touch the electrode, work clamp, or connected work pieces when this equipment is on. Insulate yourself from the electrode, work clamp, and connected work pieces.
	FUMES AND GASES CAN BE DANGEROUS: Welding may produce fumes and gases hazardous to health. Avoid breathing these fumes and gases. To avoid these dangers the operator must use enough ventilation or exhaust to keep fumes and gases away from the breathing zone.
	ARC RAYS CAN BURN: Use a shield with the proper filter and cover plates to protect your eyes from sparks and the rays of the arc when welding or observing. Use suitable clothing made from durable flame-resistant material to protect you skin and that of your helpers. Protect other nearby personnel with suitable, non-flammable screening and warn them not to watch the arc nor expose themselves to the arc.
	WELDING SPARKS CAN CAUSE FIRE OR EXPLOSION: Remove fire hazards from the welding area and have a fire extinguisher readily available. Welding sparks and hot materials from the welding process can easily go through small cracks and openings to adjacent areas. Do not weld on any tanks, drums, containers, or material until the proper steps have been taken to insure that no flammable or toxic vapors will be present. Never operate this equipment when flammable gases, vapors or liquid combustibles are present.
	ELECTRICALLY POWERED EQUIPMENT: Turn off input power using the disconnect switch at the fuse box before working on this equipment. Ground this equipment in accordance with local electrical regulations.
	ELECTRICALLY POWERED EQUIPMENT: Regularly inspect the input, electrode, and work clamp cables. If any insulation damage exists replace the cable immediately. Do not place the electrode holder directly on the welding table or any other surface in contact with the work clamp to avoid the risk of accidental arc ignition.
	ELECTRIC AND MAGNETIC FIELDS MAY BE DANGEROUS: Electric current flowing through any conductor creates electric and magnetic fields (EMF). EMF fields may interfere with some pacemakers, and welders having a pacemaker should consult their physician before operating this equipment.
	CYLINDER MAY EXPLODE IF DAMAGED: Use only compressed gas cylinders containing the correct shielding gas for the process used and properly operating regulators designed for the gas and pressure used. Always keep cylinders in an upright position securely chained to a fixed support. Do not move or transport gas cylinders with the protection cap removed. Do not allow the electrode, electrode holder, work clamp or any other electrically live part to touch a gas cylinder. Gas cylinders must be located away from areas where they may be subjected to physical damage or the welding process including sparks and heat sources.
	WELDED MATERIALS CAN BURN: Welding generates a large amount of heat. Hot surfaces and materials in work area can cause serious burns. Use gloves and pliers when touching or moving materials in the work area.
HF	CAUTION: The high frequency used for contact-free ignition with TIG (GTAW) welding, can interfere with the operation of insufficiently shielded computer equipment, EDP centers and industrial robots, even causing complete system breakdown. TIG (GTAW) welding may interfere with electronic telephone networks and with radio and TV reception.

CE COMPLIANCE: This equipment complies to the European Communities directives.

Installation and Operator Instructions

Read this entire section before installation or operation of the machine.

Location and Environment

This machine will operate in harsh environments. However, it is important that simple preventative measures are followed to assure long life and reliable operation.

- Do not place or operate this machine on a surface with an incline greater than 15° from horizontal.
- This machine must be located where there is free circulation of clean air without restrictions for air movement to and from the air vents. Do not cover the machine with paper, cloth or rags when switched on.
- Dirt and dust that can be drawn into the machine should be kept to a minimum.
- This machine has a protection rating of IP23S. Keep it dry when possible and do not place it on wet ground or in puddles.
- Locate the machine away from radio controlled machinery. Normal operation may adversely affect the operation of nearby radio controlled machinery, which may result in injury or equipment damage. Read the section on electromagnetic compatibility in this manual.
- Do not operate in areas with an ambient temperature greater than 40°C.

Input Supply Connection

Check the input voltage, phase, and frequency supplied to this machine before turning it on. The allowable input voltage is indicated in the technical specification section of this manual and on the rating plate of the machine. Verify the connection of grounding wires from the machine to the input source.

Make sure the amount of power available from the input connection is adequate for normal operation of the machine. The necessary fuse and cable sizes are indicated in the technical specification section of this manual.

The V205-T AC/DC is machine is designed to operate on engine driven generators as long as the 230Vac auxiliary can supply adequate power as indicated in the technical specification section of this manual. The auxiliary supply of the generator must also meet the following conditions.

- The AC waveform peak voltage is below 410V.
- The AC waveform frequency is between 50 and 60 hertz.
- The RMS voltage of the AC waveform is always equal to 230Vac \pm 15%.

It is important to check these conditions because many engine driven generators produce high voltage spikes. Operation of this machine on engine driven generators

not conforming to these conditions is not recommended and may damage the machine.

Output Connections

A quick disconnect system using Twist-Mate cable plugs is used for the welding cable connections. Refer to the following sections for more information on connecting the machine for operation of stick welding (MMA) or TIG welding (GTAW).

Stick Welding (MMA)

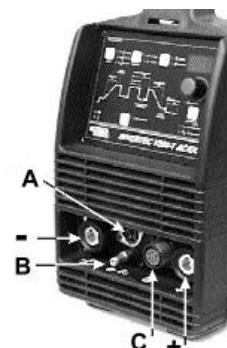

First determine the proper electrode polarity for the electrode to be used. Consult the electrode data for this information. Then connect the output cables to the output terminals of the machine for the selected polarity. For example, if DC(+) welding will be used then connect the electrode cable to the (+) terminal of the machine and the work clamp to the (-) terminal. Insert the connector with the key lining up with the keyway and rotate approximately $\frac{1}{4}$ turn clockwise. Do not over tighten.

For DC(-) welding switch the cable connections at the machine so that the electrode cable is connected to (-) and the work clamp is connected to (+).

TIG Welding (GTAW)

This machine does not include a TIG torch necessary for TIG welding, but one may be purchased separately. Refer to the accessories section for more information. Connect the torch cable to the (-) terminal of the machine and the work clamp to the (+) terminal. Insert the connector with the key lining up with the keyway and rotate approximately $\frac{1}{4}$ turn clockwise. Do not over tighten.

Connect the gas hose from the TIG torch to the gas connector (B) on the front of the machine. If necessary, an extra gas connector for the fitting on the front of the machine is included in the package. Next, connect the fitting on the back of the machine to a gas regulator on the cylinder of gas to be used. An input gas line and the required fittings are also included in the package. Connect the TIG torch trigger to the trigger connector (A) on the front of the machine. Connect the water hoses to the water connectors on the front of the Coolarc if the machine is completed with a Coolarc water-cooler.

Remote Control Connection

Refer to the accessories section for a list of remote controls. If a remote control is used, it will be connected to the remote connector (C) on the front of the machine.

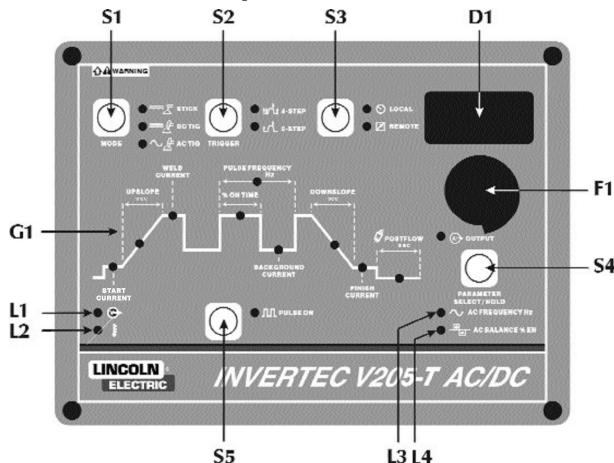

Assembly of the Coolarc 20 or Coolarc 30

A Coolarc water-cooler can be mounted below the V205-

T AC/DC or V305-T AC/DC and will convert the machine to a water-cooled system. Use a Coolarc 20 with the V205-T AC/DC and a Coolarc 30 with the V305-T AC/DC.

Disconnect the machine from the power line. On the V205-T AC/DC, remove the small excess door on the bottom of the machine and put the electrical plug of the Coolarc 20 in the connector. On the V305-T AC/DC, remove the left side panel of the machine and put the electrical plug of the Coolarc 30 in the connector located above the hole on the top shelf. Place the machine on top of the Coolarc and ensure the correct position in the prepared holes. Attach the machine to the Coolarc with the supplied screws.

Controls and Operational Features

L1 - Voltage Warning Light: This green indicator is ON when the machine is switched ON with the main switch.

L2 - Safety Warning Light: This yellow indicator is ON when a thermal overheating or incorrect supply voltage error occurs. When this indicator is ON, an alarm code will flash on the display (D1). In this condition the machine does not supply power, the output is OFF. If a thermal overheating error occurs, leave the power source ON and allow it to cool. Or, in the case of a supply voltage error, press any button to resume operation.

D1 - Display: Shows the welding current or the value of the welding parameter chosen with pushbutton S4. It is also used to display alarm or error messages and to adjust the set-up parameters.

F1 - Current and Function Control: Pre-setting of the welding current, welding parameters and set-up values. This allows you to continuously adjust the current both in TIG and in MMA welding. This current stays unchanged when the supply and welding conditions vary within the allowed ranges. In MMA welding, the presence of HOT-START and ARC-FORCE means that the average output current may be higher than that set at some stages of the welding process. Allows you to change the value, shown on the display (D1), of the parameter selected with pushbutton S4. Allows you to specify the required set-up line and to vary the value.

S1 - Mode Selection: Process selector. The LED beside the symbol will light up to confirm the selection: Stick Welding, DC TIG Welding, or AC TIG Welding.

S2 - Trigger Selection: Trigger mode selector. The LED beside the symbol will light up to confirm the selection: 4 Step operation or 2 Step operation. Refer to section below on TIG Trigger Sequences for a complete explanation of these operations.

S3 - Local/Remote Switch: Current control selector. The LED beside the symbol will light up to confirm the selection: Local Current Control (F1) or Remote Current Control.

S4 - Set-up/Parameter Switch: Allows entry into the set-up menu and parameter selection.

Parameter Selection

By pushing the pushbutton S4 (after the start up procedure) you can select the following TIG parameters:

- Start Current (A)
- Upslope Time (sec)
- Weld Current (A)
- Downslope Time (sec)
- Finish Current (A)
- Postflow Time (sec)

Press and hold the pushbutton S4 for 2 seconds to select the following AC parameters:

- AC/DC TIG Frequency (Hz)
- Wave Balance

AC Frequency

If the pushbutton S4 is held down for more than 2 seconds the AC frequency (Hz) parameter is selected and can be adjusted using the Current/Function Control (F1). Pushing the pushbutton S4 again in a short period of time, the AC balance (%) parameter is selected and can be adjusted again using the Current/Function Control (F1).

After few seconds without any changes, all the parameters are confirmed and the display D1 shows the welding current.

The parameter defaults and usable ranges are shown here.

Parameter	Value	Min	Max	Default
Start Current	Amp	8	Max	15
Upslope	Sec	0	10	0.2
Weld Current	Amp	6	Max	100
Downslope	Sec	0	10	1
Finish Current	Amp	6	Max	8
Post Flow	Sec	0.2	60	5
Frequency	Hz	0.1	500	0.5
Peak %	%	5	95	50
Background	Amp	1	Max	20
AC frequency	Hz	20	150	100
AC balance	%EN	35	85	65

Set-up Menu

To access the set-up menu start with the machine OFF. Press and hold the parameter selection button (S4) and turn the machine ON. In this mode you can now scroll through the set-up menu numbers using the current/function control (F1). Select a number in the menu you want to change, then press the parameter button (S4). Now you can change the values, using the current/function control (F1). When the desired values have been changed press the parameter selection button (S4) again to save the new value. To exit this

set-up menu, use the current/function control (F1) to scroll through to 0 and press the parameter button (S4). The display then reverts back to the main current setting and normal operation is possible.

The following parameters can be adjusted.

	Parameter	Default
0	Exit from set-up	
2	Preflow Time (0-25 sec)	0.5 sec
3	Arc-Force, percent above Peak Current for stick only (0-100%)	30%
4	Hot-Start, percent above Peak Current for stick only (0-100%)	80%
5	Setting the AC Waveform 0 = Sinusoidal 1 = Triangular 2 = Square	2
6	Min current value with Remote Control (6 Amps - Peak current)	10 A
7	Max current value with Remote Control (6 Amps - Peak current)	Peak Current
8	Lift or HF start in DC, ignored in AC 0 = HF starting 1 = Lift starting	0
9, 10, 11	Do not select or modify, used for factory settings.	
12	2 Step trigger selection 0 = restart disabled 1 = restart enabled	0
13	4 Step trigger selection 0 = restart disabled 1 = restart enabled	1
14	Electrode selection for TIG only (increase positive half wave ignition)	2.0

S5 - Pulse ON/OFF: The LED beside the symbol will light up to confirm the selection: Pulse ON or OFF.

The led on the graphic display is indicating the function and the display will show the parameter. You may select the function by pushing the parameter button (S4) and adjust the setting with the current/function control (F1).

- Frequency
- Pulse on time
- Background current

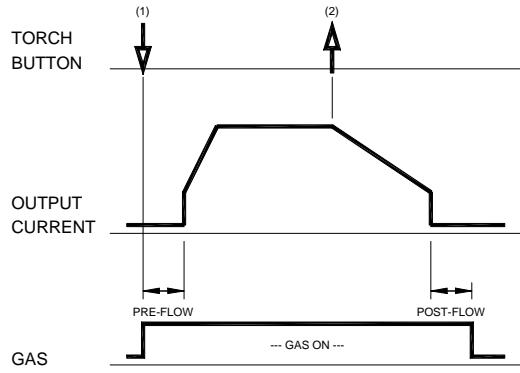

TIG Trigger Sequences

TIG welding can be done in either the 2-step or 4-step mode, which is selected with the Trigger Selection button. The specific sequences of operation for these two trigger modes are explained below.

2-Step TIG Sequence

With the 2-step trigger mode and a TIG welding mode selected, the following welding sequence will occur. To setup the machine for TIG welding refer to the Output Connections section.

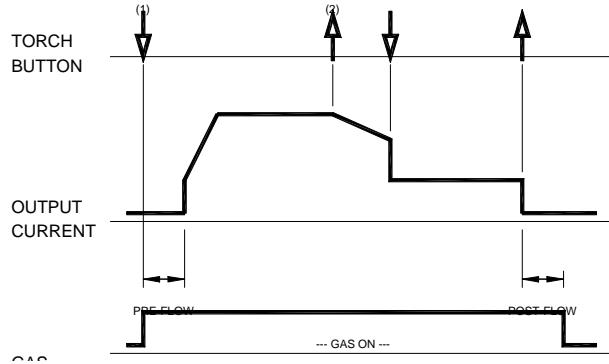

1. Press and hold the TIG torch trigger to start the sequence. The machine will open the gas valve to start the flow of the shielding gas. After the preflow time, to purge air from the torch hose, the output of the machine is turned ON. At this time the arc is started according to the selected welding mode (Lift TIG or HF TIG). The default setting is HF starting and can be changed to Lift TIG in the set-up menu.

After the arc is started the output current will be increased to the welding current. This increase or upslope time will be dependent on the times you have selected using the Parameter Selector switch.

2. Release the TIG torch trigger to stop welding. The machine will now decrease the output current at a controlled rate, or downslope time, until the Start/Crater current is reached and the output of the machine is turned OFF. The Downslope Control adjusts the downslope time.

After the arc is turned OFF, the gas valve will remain open to continue the flow of the shielding gas to the hot electrode and work piece. The Postflow Control adjusts the duration of this postflow shielding gas time.

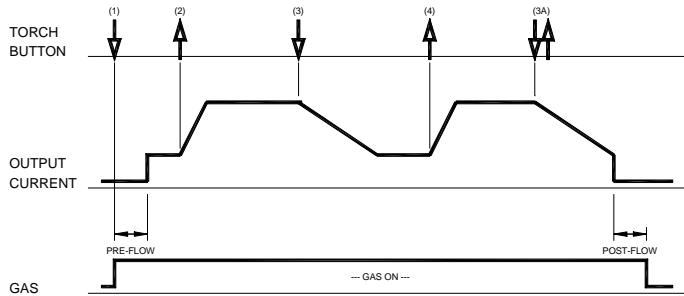

As shown above, it is possible to press and hold the TIG torch trigger a second time during downslope to end the downslope time and maintain the output current at the Start/Crater current. When the TIG torch trigger is released the output will turn OFF and the postflow time will start.

The default setting is restart disabled. Restart enabled can be selected in the set-up menu.

4-Step Sequence

With the 4-step trigger mode and a TIG welding mode selected, the following welding sequence will occur. To setup the machine for TIG welding refer to the Output Connections section.

1. Press and hold the TIG torch trigger to start the sequence. The machine will open the gas valve to start the flow of the shielding gas. After the preflow time, to purge air from the torch hose, the output of the machine is turned ON. At this time the arc is started according to the selected welding mode (Lift TIG or HF TIG). The default setting is HF starting and can be changed to Lift TIG in the set-up menu.

After the arc is started the output current will be at the Start/Crater current. This condition can be maintained as long or as short as necessary (search arc facility).

If the Start/Crater current is not necessary, do not hold the TIG torch trigger as described at the beginning of this step. Instead, quickly press and release it. In this condition, the machine will automatically pass from Step 1 to Step 2 when the arc is started.

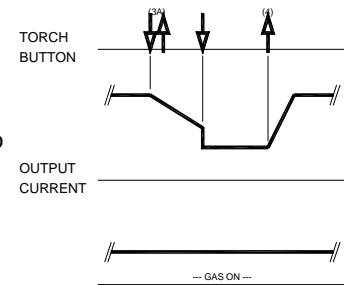

2. Releasing the TIG torch trigger starts the upslope function. The time is dependant on the upslope time you have selected using the Parameter Selector switch. The output current will be increased to the set welding current.
3. Press and hold the TIG torch trigger when the main part of the weld is complete. The machine will now decrease the output current at a controlled rate, or downslope time, until the Start/Crater current is reached. The Downslope time is dependant on the time that has been set using Parameter Selection switch. This finish/Crater current can be maintained as long or as short as necessary.

This sequence has an automatic restart so welding

will continue after this step. If the weld is completely finished, use the following sequence instead of step 3 described above.

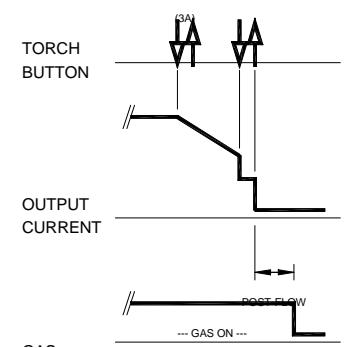

- 3A. Quickly press and release the TIG torch trigger. The machine will now decrease the output current at a controlled rate, or downslope time, until the Start/Crater current is reached and the output of the machine is turned OFF. After the arc is turned OFF the postflow time will start.
4. Release the TIG torch trigger. The output current will again increase to the welding current, like in step 2, to continue welding. When the main part of the weld is complete go to step 3.

As shown here, after the TIG torch trigger is quickly pressed and released from step 3A, it is possible to press and hold the TIG torch trigger another time to end the downslope time and maintain the output current at the Start/Crater current. When the TIG torch trigger is released the output will again increase to the welding current, like in step 4, to continue welding. When the main part of the weld is complete go to step 3.

As shown here, again after the TIG torch trigger is quickly pressed and released from step 3A, it is possible to quickly press and release the TIG torch trigger a second time to end the downslope time and stop welding.

The default setting is restart enabled. Restart disabled can be selected in the set-up menu.

Electromagnetic Compatibility (EMC)

02/02

This machine has been designed in accordance with all relative directives and norms. However, it may still generate electromagnetic disturbances that can affect other systems like telecommunications (telephone, radio, and television) or other safety systems. These disturbances can cause safety problems in the affected systems. Read and understand this section to eliminate or reduce the amount of electromagnetic disturbance generated by this machine.

This machine has been designed to operate in an industrial area. To operate in a domestic area it is necessary to observe particular precautions to eliminate possible electromagnetic disturbances. The operator must install and operate this equipment as described in this manual. If any electromagnetic disturbances are detected the operator must put in place corrective actions to eliminate these disturbances with, if necessary, assistance from Lincoln Electric.

Before installing the machine, the operator must check the work area for any devices that may malfunction because of electromagnetic disturbances. Consider the following.

- Input and output cables, control cables, and telephone cables that are in or adjacent to the work area and the machine.
- Radio and/or television transmitters and receivers. Computers or computer controlled equipment.
- Safety and control equipment for industrial processes. Equipment for calibration and measurement.
- Personal medical devices like pacemakers and hearing aids.

- Check the electromagnetic immunity for equipment operating in or near the work area. The operator must be sure that all equipment in the area is compatible. This may require additional protection measures.
- The dimensions of the work area to consider will depend on the construction of the area and other activities that are taking place.

Consider the following guidelines to reduce electromagnetic emissions from the machine.

- Connect the machine to the input supply according to this manual. If disturbances occur it may be necessary to take additional precautions such as filtering the input supply.
- The output cables should be kept as short as possible and should be positioned together. If possible connect the work piece to ground in order to reduce the electromagnetic emissions. The operator must check that connecting the work piece to ground does not cause problems or unsafe operating conditions for personnel and equipment.
- Shielding of cables in the work area can reduce electromagnetic emissions. This may be necessary for special applications.

Technical Specifications

V205-T AC/DC:
